**Narrative & Impression**

INDICATION: Right lung cancer, routine evaluation, asymptomatic.

COMPARISON: 1/31/2020

FINDINGS: PA and lateral views of the chest were obtained. A left chest wall pacemaker is seen in stable position with intact leads terminating in the region of the right atrium and right ventricle. The cardiac silhouette is partially obscured but appears relatively stable. Atherosclerotic calcifications are seen in the aorta. There is stable rightward deviation of the trachea. A large right pleural effusion is unchanged. Opacification and volume loss is seen in the right mid to lower lung. Patchy atelectasis and/or scarring in the right upper lobe and left lower lobe appears stable. No new focal airspace consolidation is appreciated. No pneumothorax.

Degenerative changes are seen throughout the spine. Bones are osteopenic. The soft tissues are normal.

**IMPRESSION:**

No significant interval change.
