IMPRESSION

ENLARGING PULMONARY LESIONS

RIGHT PLEURAL EFFUSION

FINDINGS

Conventional and thin, high-resolution views of the lungs again show multiple pulmonary lesions. A computerized search detects >100 such densities. These lesions have a variety of appearances; well-defined nodules such as a 16mm LLL nodule (302-152), more than doubled in volume from 16/07/2019 (doubling time 150 days). The RUL lesion, associated with surgical clips from prior thoracotomy, underwent biopsy on 19/01/2019.

A right pleural effusion has increased, and small, non-measurable pleural implants are evident (e.g. 3-76).

Coronary artery calcification.

מומלץ לבקר באתר אינטרנט של מכון הדימות "שיבא" בכתובת: <http://www.imaging.sheba.co.il>

שם המטופל: [REDACTED]

Moderate hiatus hernia.
Small, stable, benign-appearing left adrenal lesion (3-123).
Sigmoid diverticula present as before.
Moderate median lobe prostatic enlargement.

Parenchymal organs otherwise normal: liver, spleen, pancreas, right adrenal gland, kidneys.
Lymph node regions normal with no nodes of >10mm short axis: axillae, mediastinum, retroperitoneum, mesentery, pelvis, inguinae.
Bowel and mesentery unremarkable.
Spaces and compartments normal: pleural, pericardial, peritoneal, pelvic.
Vessels, including heart and great vessels normal: moderate vascular calcifications; normal contours and lumina.
Skin and subcutaneous tissues otherwise normal.
Skeleton otherwise normal.

HISTORY: NSCLC; SQUAMOUS. Clinical Trial. Comparison 24/11/2019 and other prior studies.
